 35 cally acceptable salts with acids such as hydrochloric, hydrobromic, sulphuric, phosphoric, acetic, citric,
 maleic, lactic, ascorbic, fumaric, oxalic, methanesulphonic and ethanesulphonic acids.

Compounds of the formula (1) may form pharmaceutically acceptable salts with metal ions, such as
 alkali metals for example sodium and potassium, or with an ammonium ion.

In order to use a compound of the formula (1) or a pharmaceutically acceptable salt thereof for the
 40 treatment of humans and other mammals it is normally formulated in accordance with standard pharmaceu-
 tical practice as a pharmaceutical composition.

Compounds of formula (1) and their pharmaceutically acceptable salts may be administered in standard
 manner for the treatment of the indicated diseases, for example orally, sublingually, parenterally, transder-
 mally, rectally, via inhalation or via buccal administration.

45 Compounds of formula (1) and their pharmaceutically acceptable salts which are active when given
 orally or via buccal administration can be formulated appropriately in dosage forms such as liquids, syrups,
 tablets, capsules and lozenges. An oral liquid formulation will generally consist of a suspension or solution
 of the compound or salt in a liquid carrier for example, ethanol, glycerine or water with a flavouring or
 colouring agent. Where the composition is in the form of a tablet, any pharmaceutical carrier routinely used
 50 for preparing solid formulations may be used. Examples of such carriers include starch, celluloses, lactose,
 sucrose and magnesium stearate. Where the composition is in the form of a capsule, any routine
 encapsulation process may be suitable, for example using the aforementioned carriers in a hard gelatin
 capsule shell. Where the composition is in the form of a soft gelatin shell capsule, any pharmaceutical
 carrier routinely used for preparing dispersions or suspensions may be considered, for example aqueous
 55 gums, celluloses, silicates or oils and are incorporated in a soft gelatin capsule shell.

Typical parenteral compositions consist of a solution or suspension of the compound or salt in a sterile
 aqueous or non-aqueous carrier optionally containing a parenterally acceptable oil or solubilising agent, for
 example polyethylene glycol, polyvinylpyrrolidone, 2-pyrrolidone, cyclodextrin, lecithin, arachis oil or ses-

ame oil.

A typical suppository formulation comprises a compound of formula (1) or a pharmaceutically acceptable salt thereof which is active when administered in this way, with a binding and/or lubricating agent, for example polymeric glycols, gelatins, cocoa-butter or other low melting vegetable waxes or fats or their synthetic analogues.

Typical transdermal formulations comprise a conventional aqueous or non-aqueous vehicle, for example a cream, ointment, lotion or paste or are in the form of a medicated plaster, patch or membrane.

Typical compositions for inhalation are in the form of a solution, suspension or emulsion that may be administered in the form of an aerosol using a conventional propellant such as dichlorodifluoromethane or trichlorofluoromethane, or are in the form of a powder for insufflation.

Preferably the composition is in unit dosage form, for example a tablet, capsule or metered aerosol dose, so that the patient may administer to himself a single dose.

Each dosage unit for oral administration contains suitably from 0.001 mg/Kg to 30 mg/Kg, and preferably from 0.005 mg/Kg to 15 mg/Kg, and each dosage unit for parenteral administration contains suitably from 0.001 mg/Kg to 10 mg/Kg, of a compound of formula (1) or a pharmaceutically acceptable salt thereof calculated as the free base.

The daily dosage regimen for oral administration is suitably about 0.001 mg/Kg to 120 mg/Kg, of a compound of formula (1) or a pharmaceutically acceptable salt thereof calculated as the free base. The daily dosage regimen for parenteral administration is suitably about 0.001 mg/Kg to 40 mg/Kg, for example about 0.005 mg/Kg to 10 mg/Kg, of a compound of the formula (1) or a pharmaceutically acceptable salt thereof calculated as the free base. The active ingredient may be administered as required, for example from 1 to 8 times a day or by infusion. The compositions of the invention are bronchodilators and are useful in chronic reversible obstructive lung disease for example asthma and bronchitis. Some of the compositions of the present invention have anti-allergic activity and are therefore useful in combatting allergic diseases such as allergic asthma, allergic rhinitis, urticaria and irritable bowel syndrome. The compositions of the present invention have vasodilator activity and are of use in the treatment of angina, hypertension and congestive heart failure. Such conditions can be treated by administration orally, sublingually, topically, rectally, parenterally or by inhalation. For administration by inhalation dosages are controlled by a valve, are administered as required and for an adult are conveniently in the range 0.1-5.0 mg of a compound of the formula (1) or a pharmaceutically acceptable salt thereof.

The compounds of this invention may be co-administered with other pharmaceutically active compounds, for example in combination, concurrently or sequentially. Conveniently the compounds of this invention and the other active compound or compounds are formulated in a single pharmaceutical composition. Examples of compounds which may be included in pharmaceutical compositions with the compounds of the formula (1) are bronchodilators such as sympathomimetic amines for example isoprenaline, isoetharine, salbutamol, phenylephrine and ephedrine or xanthine derivatives for example theophylline and aminophylline, anti-allergic agents for example disodium cromoglycate, histamine H₁-antagonists, vasodilators for example hydralazine, angiotensin converting enzyme inhibitors for example captopril, anti-anginal agents for example isosorbide nitrate, glyceryl trinitrate and pentaerythritol tetranitrate, anti-arrhythmic agents for example quinidine, procainamide and lignocaine, calcium antagonists for example verapamil and nifedipine, diuretics such as thiazides and related compounds for example bendroflumazide, chlorothiazide, chlorothalidone, hydrochlorothiazide, and other diuretics for example frusemide and triamterene, and sedatives for example nitrazepam, flurazepam and diazepam.

In another aspect the present invention provides a process for the preparation of a compound of the formula (1) or a pharmaceutically acceptable salt thereof, which process comprises :

- a) for compounds wherein R² is hydrogen, C₁₋₄-alkyl, phenyl or CF₃,
reacting a compound of the formula (2) :

- wherein R¹ is as hereinbefore defined and R⁶ is a group R³ as hereinbefore defined or a precursor thereof,
 with a compound of the formula R⁷COL or a chemical equivalent thereof wherein R⁷ is hydrogen, C₁₋₄alkyl, phenyl or CF₃ and L is a leaving group;
- 5 b) for compounds wherein R² is hydroxy,
 reacting a compound of the formula (2) as hereinbefore defined with a carbonylating agent;
- c) for compounds wherein R² is mercapto,
 reacting a compound of the formula (2) as hereinbefore defined with thiourea;
- 10 d) for compounds wherein R² is C₁₋₄alkylthio,
 reacting a compound of the formula (2) as hereinbefore defined with thiourea and thereafter with a C₁₋₄alkyl halide;
- e) for compounds wherein R² is amino,
 reacting a compound of the formula (2) as hereinbefore defined with cyanogen bromide;
 and thereafter where necessary :
- 15 • converting a group R⁶ to a group R³;
 • optionally forming a pharmaceutically acceptable salt.

The reaction between a compound of the formula (2) and a compound of the formula R⁷COL is conveniently performed in the absence of a solvent or in the presence of a suitable solvent such as a C₁₋₄alcohol, pyridine or N-methylpyrrolidone, at ambient or elevated temperature, for example 50-250 °C, preferably 100-200 °C. Suitably L is selected from hydroxy, C₁₋₄alkoxy, halo such as chloro or bromo, amino, C₁₋₄alkylamino or OCOR⁷ thus forming an acid anhydride. By a chemical equivalent of R⁷COL is meant a reagent that will react in similar manner with a compound of the formula (2) to form a purine ring. Examples include amidines of the formula R⁷C(NH)L¹ wherein L¹ is amino or C₁₋₄alkylamino, and alkyl orthoformates of the formula R⁷C(L²)₃ wherein L² is C₁₋₄alkoxy.

25 The reaction between a compound of the formula (2) and a carbonylating agent is conveniently performed in the absence of a solvent or in a suitable solvent such as a halohydrocarbon, pyridine or toluene, at ambient or elevated temperature, for example 50-250 °C. Suitable carbonylating agents include urea, di(C₁₋₄alkyl)-carbonate, C₁₋₄alkyl chloroformate, phosgene, trichloromethyl chloroformate or carbonyldiimidazole.

30 The reaction between a compound of the formula (2) and thiourea is conveniently performed in the absence of a solvent or in a suitable solvent such as a halohydrocarbon, pyridine or toluene, at elevated temperature for example 50-250 °C, optionally in the presence of a base such as potassium acetate. If desired the product from this reaction can suitably be reacted with a C₁₋₄alkyl halide, for example methyl iodide, in the presence of a base such as aqueous sodium hydroxide at ambient or elevated temperature e.g. 40-100 °C.

35 A compound of the formula (2) is suitably reacted with cyanogen bromide in a solvent such as a C₁₋₄alcohol, pyridine or acetonitrile optionally in the presence of water at ambient or elevated temperature, e.g. 40-100 °C.

40 Examples of R⁶ being a precursor to a group R³ is when R⁶ is a C₁₋₄alkylthio or C₁₋₄alkoxycarbonyl group.

Suitably a C₁₋₄alkylthio group can be converted to a C₁₋₄alkylsulphinyl group by treatment with one mole equivalent of an oxidising agent such as hydrogen peroxide or potassium periodate. A further mole equivalent of an oxidising agent such as hydrogen peroxide or potassium permanganate can be used to convert a C₁₋₄alkylsulphinyl group to a C₁₋₄alkylsulphonyl group.

45 A C₁₋₄alkoxycarbonyl group can be converted to a CONR⁴R⁵ group by reaction with an amine HNR⁴R⁵ wherein R⁴ and R⁵ are as hereinbefore defined.

A compound of the formula (1) wherein R³ is hydrogen can be converted to the corresponding compound wherein R³ is 5-nitro by reaction with a suitable nitrating agent, such as fuming nitric acid together with sulphuric acid.

50 A compound of the formula (1) wherein R³ is nitro can be converted to the corresponding compound wherein R³ is amino by reaction with a reducing agent, for example via catalytic hydrogenation with palladium on carbon. If desired the amino group can be converted to a C₁₋₄alkanoylamino group by treatment with a C₁₋₄alkanoylating agent, for example acetic anhydride.

55 Alternatively a compound of the formula (1) wherein R³ is amino can be treated with sodium nitrite and an inorganic acid such as sulphuric acid to form a diazonium salt which can be converted to compounds of the formula (1) wherein R³ is cyano or halo by reaction with cuprous cyanide or cuprous halide.

A compound of the formula (1) wherein R³ is cyano can be hydrolysed to the corresponding compound wherein R³ is carboxamido by treatment with concentrated sulphuric acid or by treatment with hydrogen

peroxide and potassium hydroxide.

A compound of the formula (1) wherein R^3 is hydrogen can be converted to the corresponding compound wherein R^3 is $5\text{-SO}_2\text{NR}^4\text{R}^5$ by reaction with chlorosulphonic acid and thereafter with an amine HNR^4R^5 wherein R^4 and R^5 are as hereinbefore defined.

As will be readily understood by the man skilled in the art, reactive groups in other parts of the molecule (e.g. when R^2 is amino) can be protected before the group R^3 is converted as hereinbefore described.

Compounds of the formula (2) are known or preparable in conventional manner from US Patents 3819631 and 4039544.

Pharmaceutically acceptable acid addition salts of the compounds of the formula (1) wherein R^2 is hydrogen or amino, or R^3 is amino may be prepared from the corresponding base of the compounds of the formula (1) in conventional manner. For example the base may be reacted with an acid in a C_{1-4} alcohol, or an ion-exchange resin may be used. The salts of the compounds of the formula (1) may be interconverted using ion-exchange resins. Non-pharmaceutically acceptable salts are therefore of use as they can be converted to pharmaceutically acceptable salts.

Pharmaceutically acceptable base addition salts of the compounds of the formula (1) may be prepared by standard methods, for example by reacting a solution of the compound of the formula (1) with a solution of the base.

The following biological test method, data, descriptions and Examples serve to illustrate this invention.

Bronchodilatation - In vivo

Male guinea-pigs of the Dunkin Hartley strain (500 - 600g) were anaesthetised with Sagatal (pentobarbital sodium) (60 mg/kg). Airway resistance was measured using a modification of the classical Konzett-Rossler technique (J. Pharm. Methods, 13, 309-315, 1985). U46619 (9,11-methanoepoxy-PGH₂) was infused i.v. at a rate of 2.5 nmol/min, this produced a steady state of bronchoconstriction (approximately 120% increase from basal airway resistance). The compound under test was administered by i.v. bolus injection, and the subsequent peak inhibition of bronchoconstriction recorded.

The dose of compound required to reduce the U46619-induced bronchoconstriction by 50% is given as the BD_{50} . The compounds of Examples 2, 3, 6, 11, 14 and 15 had BD_{50} values in the range 0.58-7.24 $\mu\text{mol/kg}$. These results demonstrate in vivo anti-bronchoconstrictor activity.

Anti-allergic activity

Male Duncan Hartley guinea-pigs (250-300 g) were sensitised to ovalbumen by i.p. injection of 2 ml of 50mg.ml⁻¹ i.p. and 0.2 ml s.c. Three weeks later they were anaesthetised with 60mg.kg⁻¹ sodium pentobarbitone. The trachea was cannulated and the animal respired at a rate of 40 breaths per minute and at an initial tracheal inflation pressure of 16 mmHg. Tracheal inflation pressure was measured by a transducer connected to a side arm of the respiration circuit. The carotid artery was cannulated for the measurement of blood pressure and the signal was used to trigger an instantaneous rate meter. A jugular vein was cannulated for the administration of drug and allergen. After surgery the animals were allowed to stabilise and the drug was administered i.v. as a bolus. Following this, ovalbumen 1mg.kg⁻¹ was injected i.v. as the antigen challenge either 2, 15 or 30 minutes following drug treatment and the peak bronchoconstrictor response recorded. For the control group ovalbumen only was given. One ovalbumen challenge per guinea-pig was used and $n = 6$ for each time point. The percentage increase in tracheal inflation pressure was calculated. The following results indicating an anti-allergic activity were obtained.

Compound of Example	Dose $\mu\text{mol/kg}$	% Inhibition of Control Bronchoconstrictor Response 30 min after drug administration
3	18.4	24
15	16.6	30

Phosphodiesterase activity

The activity of the compounds of the present invention as inhibitors of a calmodulin insensitive cyclic GMP phosphodiesterase was measured using the procedure described in European Patent Application No.

293063. The compounds of Examples 2-4, 6, 8, 9 and 11 to 15 had IC_{50} values (the concentration of inhibitor required for 50% inhibition of enzyme activity) in the range 0.31 to 4.80 μ M. The compounds of the present invention have the advantage that they are selective in not inhibiting cyclic AMP phosphodiesterase (type III).

The mixture was evaporated under reduced pressure to a quarter volume, diluted with cold water (400 ml) and 2 Normal hydrochloric acid was added to pH 6. Filtration gave 4-amino-5-nitroso-2-(2-[2,2,2-
45 trifluoroethoxy]phenyl)pyrimidin-6-one, 5.79 g, m.p. 210-212°C, which was used directly in the next stage.

The cold mixture was filtered to give crude 4,5-diamino-2-(2-[2,2,2-trifluoroethoxy]phenyl)pyrimidin-6-one, which was dissolved in the minimum volume of hot ethanol and converted into the sulphate salt (2.33 g, m.p. 255-260°C dec) by the addition of sulphuric acid. Recrystallisation from 50% aqueous ethanol gave the hemisulphate as a partial hydrate, m.p. ca. 210-220°C dec.

55 e) A stirred mixture of the above diamine hemisulphate (1.1 g) and formamide (11 ml) was heated in an oil bath (temperature 195°C) for 2 hours. The solution was cooled and diluted with water (44 ml) to give 0.92 g of a solid m.p. 261-263°C. Recrystallisation from ethanol gave the pure title compound, 0.77 g, m.p. 276-277°C (transition 263°C).

The resultant solid was digested with warm water and the mixture filtered to afford a solid (0.74 g) which was twice recrystallised from dimethylformamide to afford a crude product (0.34 g). This together with another sample (0.22 g) similarly prepared from 4,5-diamino-2-(2-cyclopropylmethoxyphenyl)pyrimidin-6-one (0.45 g) was twice recrystallised from dimethylformamide to afford the title compound, 0.34 g, m.p. 329-331 °C.

A solution of sodium dithionite (1.9 g) in water (10 ml) was added dropwise over 5 minutes and heating continued for a further 10 minutes. The solution was cooled to room temperature, poured into saturated aqueous sodium hydrogen carbonate (250 ml) and extracted with dichloromethane. The organic extract was dried (magnesium sulphate), concentrated to ca 50 ml and treated with carbonyl diimidazole (1.3 g). After 16 hours, solvents were removed in vacuo and the residue recrystallised from dimethylformamide/water to afford the title compound, 1.2 g, m.p. 295 °C (dec).
